USDA

United States Department of Agriculture

Attractiveness of Agricultural Crops to Pollinating Bees for the Collection of Nectar and/or Pollen

Non-Discrimination Statement

Non-Discrimination Policy

The U.S. Department of Agriculture (USDA) prohibits discrimination against its customers, employees, and applicants for employment on the bases of race, color, national origin, age, disability, sex, gender identity, religion, reprisal, and where applicable, political beliefs, marital status, familial or parental status, sexual orientation, or all or part of an individual's income is derived from any public assistance program, or protected genetic information in employment or in any program or activity conducted or funded by the Department. (Not all prohibited bases will apply to all programs and/or employment activities.)

To File an Employment Complaint

If you wish to file an employment complaint, you must contact your agency's EEO Counselor (PDF) within 45 days of the date of the alleged discriminatory act, event, or in the case of a personnel action. Additional information can be found online at http://www.ascr.usda.gov/complaint_filing_file.html.

To File a Program Complaint

If you wish to file a Civil Rights program complaint of discrimination, complete the USDA Program Discrimination Complaint Form (PDF), found online at http://www.ascr.usda.gov/complaint_filing_cust.html, or at any USDA office, or call (866) 632-9992 to request the form. You may also write a letter containing all of the information requested in the form. Send your completed complaint form or letter to us by mail at U.S. Department of Agriculture, Director, Office of Adjudication, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, by fax (202) 690-7442 or email at program.intake@usda.gov.

Persons with Disabilities

Individuals who are deaf, hard of hearing or have speech disabilities and you wish to file either an EEO or program complaint please contact USDA through the Federal Relay Service at (800) 877-8339 or (800) 845-6136 (in Spanish).
Persons with disabilities who wish to file a program complaint, please see information above on how to contact us by mail directly or by email. If you require alternative means of communication for program information (e.g., Braille, large print, audiotape, etc.) please contact USDA's TARGET Center at (202) 720-2600 (voice and TDD).

Supplemental Nutrition Assistance Program

For any other information dealing with Supplemental Nutrition Assistance Program (SNAP) issues, persons should either contact the USDA SNAP Hotline Number at (800) 221-5689, which is also in Spanish or call the State Information/Hotline Numbers.

All Other Inquiries

For any other information not pertaining to civil rights, please refer to the listing of the USDA Agencies and Offices for specific agency information.

Table of Contents

Executive Summary

The protection of bee pollinators, *e.g.*, honey bees (*Apis mellifera*) and non-*Apis* bees in the United States has grown increasingly important, because declines in their populations have the potential to impact food security due to loss of pollination services. Several key factors have been implicated in overall honey bee colony losses, including pesticides. The U.S. Environmental Protection Agency (EPA) risk assessment process for pesticides includes an evaluation of risk to bee pollinators. This document provides a compilation of information on the attractiveness of crops grown in the United States to pollinating bees as food sources of pollen and nectar, and agronomic practices that are relevant to the interactions between these insects and the crops. The information provides a starting point for the risk assessment process for pollinating bees in terms of determining the potential for exposure to pesticide applications on these crops. In addition, the information contained in this resource will help to inform decisions to pursue further refinements in the risk assessment process as well as options for risk mitigation.

Introduction

The number of managed honey bee colonies in the U.S. has declined over the past 60 years and there are indications that the number and diversity of insect pollinators in general have also declined in North America[1]. Additionally, populations of some non-*Apis* bee species have declined in recent decades[2,3,4]. Although multiple factors have been associated with declines in *Apis* and non-*Apis* bees (*e.g.*, arthropod pests, disease, poor nutrition, decreases in the diversity of food resources for bees, loss of habitat, lack of genetic diversity and pesticides), no single factor or specific combination of factors has been identified as the principal cause[5]. The U.S. Department of Agriculture (USDA) has been tasked by Congress to identify and to develop means to mitigate the causes of honey bee declines[6]. Although pesticides alone have not been implicated as the principal cause of overall bee pollinator declines, the EPA and USDA have been working collaboratively to understand the potential role that pesticides may be playing, particularly in combination with other identified factors.

In September, 2012, scientists from the EPA Office of Pesticide Program's Environmental Fate and Effects Division, in collaboration with Health Canada's Pest Management Regulatory Agency and the California Department of Pesticide Regulation, presented a White Paper[7] to the Federal Insecticide, Fungicide and Rodenticide Act Scientific Advisory Panel (SAP) on a proposed framework for assessing risks of pesticides to bees in order to protect pollination services, production of hive products, and bee pollinator biodiversity. The proposed process for

assessing risks to bees, using honey bees as a surrogate for non-*Apis* bees as well, serves as a means to advance the science and to allow EPA to quantitatively assess the potential risk of pesticides to managed bees (*Apis* and non-*Apis*) and feral non-*Apis* bees.

The proposed framework for assessing risk to bees is similar to the process used by the EPA Office of Pesticide Programs for other taxa[8]; however, the biology of insect pollinators such as honey bees presents special considerations, which warrant a dedicated framework. Bee species can exhibit a wide range of social interaction/structure, with social structure of the various species affecting routes for potential exposure to pesticides. Often, the major commercial bee pollinators are either honey bees or bumble bees, but in some cases certain solitary bee species are also used commercially, *e.g*., blue orchard bees (*Osmia lignaria*) and alfalfa leafcutter bees (*Megachile rotundata*).

It is also important to note that risk assessors may have to evaluate a wide variety of plant types as a result of pesticide use patterns, from forestry and ornamental uses to use in crops, such as corn (*Zea mays*) and canola (*Brassica napus*). These uses may differ in regards to need and timing of commercial insect pollination services. However, some crops may be pollinator-dependent or pollinator-attractive when in bloom, but they may be typically harvested before flowering (*e.g.*, lettuce) and would not represent a route of exposure based on typical cultivation practices. In other cases, some crop flowers are visited by solitary bees or bumble bees but not by honey bees. All of these pieces of information are essential to the understanding of bee pollinator visitation to a plant/crop of interest and the consequent need to assess the risk to bee pollinators from a pesticide application to this plant/crop.

As the SAP highlighted in the following conceptual model for the tiered approach in risk assessments to *Apis* and non-*Apis* bee pollinators (**Figure 1, Boxes 2a and 2b**), the first step of a risk assessment is to evaluate whether there is the potential for exposure. Therefore, information on the pollination biology of each plant/crop is needed to determine if bees are likely to visit the plants that are identified for pesticide applications. In addition, a risk assessor also needs information on the application rate, timing, method of application, and environmental fate of a pesticide in order to evaluate potential routes of exposure. Together, these pieces of information enable a risk assessor to determine if the proposed application of a pesticide leads to probable routes of exposure that could coincide with the timing of bee pollinator visitation to the plant/crop that is under consideration. In all cases, registrants provide information on the

[8] USEPA. 2004. Overview of the Ecological Risk Assessment Process in the Office of Pesticide Programs. U.S. Environmental Protection Agency, Endangered and Threatened Species Effects Determinations. http://www.epa.gov/espp/consultation/ecorisk-overview.pdf . Last accessed 1/6/15.

application rate, timing, method of application, and environmental fate of a chemical when a new pesticide use pattern is proposed. However, to complement the use information, a comprehensive and robust source of information on the pollination ecology of the plants to which the pesticide is to be applied (*i.e.*, target plant) is needed to evaluate whether proposed uses for pesticide applications represent a potential exposure to either adult or immature (brood) bees.

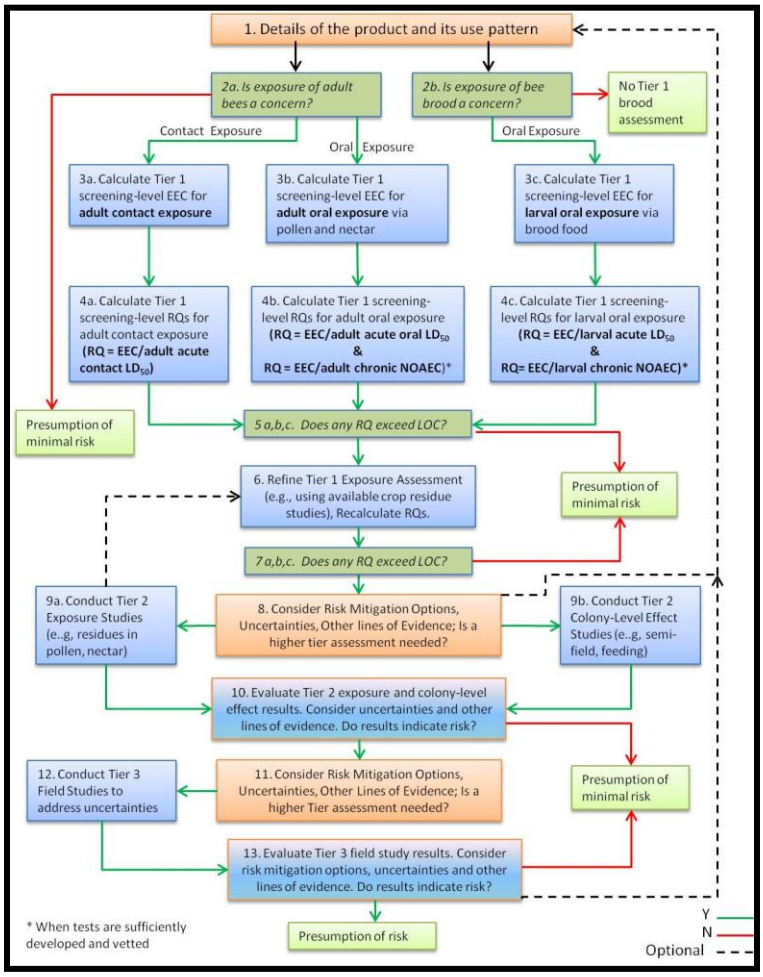

Figure 1. Example tiered approach for assessing risk to honey bees from foliar spray applications.

Development of the Pollinator Attractiveness Crop List

In order to assess the potential for *Apis* and non-*Apis* bees to be exposed to pesticides applied to various crops, relevant data and agronomic practices connected to the pollination of these plants/crops are needed. These data include a measure of attractiveness to pollinating bees (*i.e*., honey bees, bumble bees, and solitary bees) to each plant and/or crop, the phenology of the bloom period, use/non-use of managed pollinators, and the acreage of the various crop/plant groups in the United States.

The goal of this effort is to compile information on the attractiveness of crops grown in the United States to pollinating *Apis* and non-*Apis* bees as food sources of pollen and nectar. To achieve this goal, the EPA, USDA, and Michigan State University Extension Entomologist

Dr. Rufus Isaacs initiated a project to gather the relevant information to serve as a resource for pesticide risk assessments. The tables described here entitled "*Bee Pollinator Attractive Crops List*" (**Tables 1** and **2**) were developed to provide a relative rating of the degree to which honey bees, bumble bees, and solitary bees utilize the various crops grown in the United States. This list was informed by previous work conducted and recently published by the European Food Safety Authority (EFSA)[9] for assessing pesticide risks to bees and adapted for the specific situations and regulatory data needs for the EPA.

Information for the Bee Pollinator Attractive Crops List (**Tables 1** and **2**) was collected from multiple sources, including peer-reviewed published information, university and agricultural extension resources, and expert opinion based on experience with the pollination of specific crops. The published information included the key texts of McGregor[10], Free[11], and Delaplane and Mayer[12]. Additionally, primary research publications were used where appropriate, and these are listed in **Table 3**. Online or published articles from expert knowledge of specific agricultural crop systems were also used to complete these entries, based on the experience of entomologists that work in crop pollination and bee keeping or from state agricultural extension

agencies. When expert opinion was used as the source of information, the source is also identified in **Table 3**. If information could not be identified from publications or expert opinion to address a specific aspect of the pollination biology of the plant or its associated typical agronomic practice, the corresponding cells in **Tables 1** and **2** were left blank and this aspect of the crop remains an uncertainty.

There are specific considerations for some of the data listed in **Tables 1** and **2** related to the rating of attractiveness of pollen and/or nectar resources to bees. For each of the crops listed, the degree to which pollen and nectar are attractive and used by honey bees is listed using a scale where "-" = not attractive, "+" = attractive under certain conditions, and "++" = high attractiveness in all cases. The same rating system is used for bumble bees and for solitary bees with the major groups of solitary bees likely to be found at flowers of each crop listed, if known. The ratings for bumble bee and solitary bee taxa do not address pollen and nectar separately, however. The different attractiveness ratings are based on the degree to which information qualitatively indicates that they are used by bees. If the cited information indicates that certain bees frequently visit and extensively use a particular floral resource, then it is given the classification of "++" for the respective type of bee. If, however, information indicates that certain bees only visit a crop infrequently (*e.g.*, only under conditions of few alternative food sources) or few bees are noted to forage on a given crop resource, it is given the classification of "+" for the appropriate taxa of bee. Despite the relatively lower level of attractiveness compared to crops with a "++" rating, it is important to note that crops designated with a "+" may still become a major source of food for bees depending on the environmental conditions. For example, a crop that under normal conditions bees would only minimally use as a forage source, could be extensively used during certain time periods due to the lack of alternative available forage (*e.g.*, drought, flooding, *etc.*). Additionally, nearby competing crops which may be more pollinator attractive may draw away some groups of pollinators due to the ease of obtaining pollen/nectar. Finally, when the various groups of bees are noted to be absent from a particular crop or resource, this crop is noted with a "-" for the appropriate type of bee. When crop specific information was available, attractiveness ratings are based on the inherent attractiveness of the crop to pollinating bees and not based on specific agronomic practices such as harvest prior to bloom. It is assumed that a crop that is harvested prior to bloom would be "unattractive" to pollinating bees as it would not provide flowers for visitation during typical cultivation.

There are also considerations specifically related to **Table 1** given that for most of the crops data were already available in the EFSA guidance document[13]. The first consideration is that if the specific attractiveness rating was not listed in the EFSA guidance document for solitary

[13] *Ibid*. European Food Safety Authority, 2013.

bees, but rather only the type of bee was listed to denote floral visitation by that bee, then a "+" rating is applied in **Table 1** to denote that solitary bees visit the specific crop. The second consideration is that in many cases data were already available for the various crops in the EFSA document. Where additional data could not be found, the data in **Table 1** show the attractiveness ratings simply based on the EFSA guidance document. If other data provided clarification on additional bee taxa not addressed by EFSA and/or simply confirmed the EFSA data, then the EFSA data were combined with the additional data source noted in the reference. In some cases, other data sources modified the ratings provided by EFSA and these citations are provided in the references column.

In some cases, information is lacking for a crop, but another crop is identified as a surrogate for the rating of attractiveness to bees given similarity in plant family or crop group. In these cases, the surrogate is identified in the "Reference" column and serves as a reasonable assumption of attractiveness to bees. It should be noted, however, that there is uncertainty in the use of surrogate plants for the rating, as attractiveness may vary even within plant families.

Whether a crop requires bee pollination or not includes specific considerations related to the agronomic practices of the crop. The entry for 'requires bee pollination' refers to harvestable, productive crop yields rather than any specific level of fruit set. Consequently, if a crop "requires bee pollination" then the specific crop requires either specific bee taxa or bees in general to produce productive and harvestable crop yields. If a crop does not require bee pollination, then the specific crop attains harvestable and productive crop yields via other pollination methods aside from bees, such as through wind, mammal, or other invertebrate (*e.g.*, butterfly) pollination. Whether the crop requires bee pollination is listed based on the information provided in the cited reference, which provides information on whether the crop has a dependence on bee-mediated pollen transfer for the production of seeds, nuts, or fruit. This information is specifically for the production of the edible crop parts that will be harvested and sold. Many crops do not require bees for pollination to produce marketable yields, yet they do require bees for breeding or seed production (*i.e.,* intended for crop propagation), which is typically a very small proportion of the total crop acreage. In these cases the crops are stated as requiring bee pollination and the "Notes" column of **Tables 1 and 2** state if the requirement is only for seed production. Finally, some crops may produce flowers during the typical production of the harvestable part of the crop but does not require bee pollination. In these cases, exposure to bees is assumed and the attractiveness ratings of the crop to bees are specified in **Tables 1**

and **2**.

Attractiveness of Agricultural Crops to Pollinating Bees for the Collection of Nectar and/or Pollen, **2017**

Many crops in **Tables 1** and **2** employ commercial honey bee colonies (or colonies of other types of bees) that are rented by the grower and provided by a beekeeper to provide pollination services. If that is likely to happen within a cropping system within the United States, based on the information provided in the cited reference, it is listed as "Yes" in the “Uses Managed Pollinators” column. If that does not happen based on the designation of not requiring bee pollination, then the column has a "No" entry based on inference drawn from the column on bee pollination requirements.

Use of the Pollinator Attractiveness Crop List

As part of its pesticide ecological risk assessments, the EPA intends to consider the information on pollinator attractiveness provided in **Tables 1** and **2** in determining the potential for bees to be exposed to pesticides from the crop itself following application to a specific crop. If a risk assessment is warranted, other information included in **Tables 1** and **2** can assist in refining the scope of the risk assessment. The other information includes the spatial extent of treated crops, the timing of application in relation to likely periods of bee visitation, and agronomic practices that may affect the exposure of the bees (*e.g.,* harvesting prior to bloom). Where necessary, information in this list may be supplemented with additional information on a case-by-case basis (*e.g*., crop and region-specific information from local agricultural extension experts).

Table 1. Summary of the attractiveness to *Apis* and non-*Apis* bees of crops grown in the U.S., whether crop requires bee pollination and if so, whether managed pollinators are used.

Also summarized is the bearing acreage of the crop, the extent to which the crop is used in seed production and whether the crop is harvested prior to bloom. The degree to which pollen and nectar are attractive is listed using a scale where "-" = not attractive, "+" = attractive under certain conditions, and "++" = high attractiveness; entry “N/AV” specifies when crop-specific data are unavailable; entry “N/AP” specifies when crop-specific data are not applicable.

Crop	Description	HB Poll.[1]	HB Nec.[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Ref No.	U.S. Bearing Acreage[2]	Seed Production[7]	Harvest Prior to Bloom	Notes

Viper's grass	*Scorzonera hispanica*	+	+	+	+	Yes	No	43	N/AV			*Note citation is not yet published*
Walnuts with shell	*Juglans* spp.: *J. regia*.	+	-	-	-	No	No	EFSA, 45	245,000			Wind pollinated
Watermelons	*Citrullus vulgaris*	+	+	+	+ *Agapostemon, Floridegus, Halictus, Hoplitus, Melissodes*	Yes	Yes	1	123,330			
Wheat	*Triticum* spp.: common (*T. aestivum*), durum (*T. durum*), spelt (*T. spelta*).	-	-	-	-	No	No	3	45,157,000			

† Major crops based on Appendix D in the EFSA bee risk assessment guidance document and their attractiveness to pollinating bees. The table also contains relevant agronomic information associated with each crop. The entry "N/AV" specifies when crop-specific data are unavailable. Where "EFSA" is listed as the reference for a specific crop in this table, the data from Appendix D in the EFSA bee risk assessment guidance are used as the sole source of information on attractiveness ratings as no additional data were identified.

[1] HB= honey bee; Pol = Pollen; Nec = Nectar

[2] Estimates from the Census of Agriculture have a 2012 harvested acreage date. NASS fruit estimates have a 2012 reference date and vegetables refer to 2013. Fruit estimates are in bearing acres. Field crops and specialty crops are reported in harvested acres. All Census estimates are reported in harvested acreage. N/AV = not available. Please refer to reference 48 in **Table 3** for the citation related to these data.

[3] Extra-floral nectaries

[4] Mainly on extra-floral nectaries

[5] Unmanufactured tobacco

[6] Extrapolation based on wheat and rye

[7] Seed production refers to crops grown to produce seeds intended for crop propagation rather than for human or livestock consumption

Table 2. Additional crops identified in the 40 CFR crop groupings and their attractiveness to *Apis* and non-*Apis* bees, whether crop requires bee pollination and if so, whether managed pollinators are used.

The degree to which pollen and nectar are attractive is listed using a scale where "-" = not attractive, "+" = attractive under certain conditions, and "++" = high attractiveness; entry “N/AV” specifies when crop-specific data are unavailable. The table also contains relevant agronomic information associated with each crop.

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Arracha (PR) *Arracacia xanthorrhiza* (Apiaceae)	Roots and tuber vegetables	+	+	+	+	Yes	No	Extrapolated from carrot in **Table 1**	Bees important for seed production. Typically harvested prior to bloom.
Arrowroot *Maranta arundinacea* (Marantaceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Chinese artichoke *Stachys affinis* (Lamiaceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Jerusalem artichoke (Asteraceae)	Roots and tuber vegetables	+	+	+	+	No	No	38	Some genotypes produce viable seed which is generated by cross pollination by bees, mainly non-*Apis*.
Edible burdock (Asteraceae)	Roots and tuber vegetables	+	+	+	+	No	No	Extrapolated from Jerusalem artichoke above	
Edible canna (Cannaceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Cassava (Euphorbiaceae)	Roots and tuber vegetables	-	-	-	-	No	No	3	
Turnip-rooted chervil (Apiaceae)	Roots and tuber vegetables	+	+	+	+	For seed production, only	No	Extrapolated from coriander in **Table 1**	Only a small % of acreage is grown for seed. Typically harvested prior to bloom.

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Chufa (Cyperaceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Dasheen (Araceae)	Roots and tuber vegetables	+	+	N/AV	N/AV	No	No	46, 77	Cultivated primarily vegetatively
Ginger (PR) (Zingiberaceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Ginseng (Araliaceae)	Roots and tuber vegetables	N/AV	N/AV	N/AV	+	No	No	75	
Horseradish (Brassicaceae)	Roots and tuber vegetables	+	+	+	+	No	No	Attractiveness extrapolated from radish below	Asexual reproduction through root propagation.
Leren (PR) (Marantaceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Turnip rooted parsley (Apiaceae)	Roots and tuber vegetables	+	+	+	+	No	No	Extrapolated from parsley below	Bees important for seed production. Typically harvested prior to bloom.
Parsnip (Apiaceae)	Roots and tuber vegetables	+	+	+	+	For seed production, only	No	3	Only a small % of acreage is grown for seed. Typically harvested prior to bloom.
Radish (Brassicaceae)	Roots and tuber vegetables	+	+	+	+ *Megachile*	For seed production, only	For seed production, only	3	Only a small % of acreage is grown for seed. Honey bees are the primary pollinators. Typically harvested prior to bloom.
Rutabaga and turnip (Brassicaceae)	Roots and tuber vegetables	++	++	+	+	For seed production, only	For seed production, only	3	Only a small % of acreage is grown for seed. Small % of acreage. Typically harvested prior to bloom.

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Salsify, (oyster plant) (Asteraceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Salsify, spanish (Asteraceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Skirret (Apiaceae)	Roots and tuber vegetables	+	+	+	+	Yes	No	Extrapolated from carrot on **Table 1**	Bees important for seed production. Typically harvested prior to bloom.
Tanier (Araceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Yam bean (Fabaceae)	Roots and tuber vegetables	+	+	+	+	No	No	Extrapolated from Bean (lupinus) below	
True yam (Dioscoreaceae)	Roots and tuber vegetables	*Uncertainty*[a]							
Chive, Chinese (Liliaceae)	Bulb vegetables	+	++	+	+	For seed production, only	No	Extrapolated from chive above	Only a small % of acreage is grown for seed.
Daylily, bulb (Liliaceae)	Bulb vegetables	-	-	-	-	No	No	12	Primarily moth and butterfly pollinated
Elegans hosta (Liliaceae)	Bulb vegetables	+	-	+	+	No	No	7	
Fritillaria (Liliaceae)	Bulb vegetables	+	+	+	+	No	No	13	
Garlic, great headed (Liliaceae)	Bulb vegetables	+	+	+	+	No	No	3, 81	Rarely grown for seed
Garlic, serpent (Liliaceae)	Bulb vegetables	+	+	+	+	No	No	Extrapolated from great headed garlic above	Rarely grown for seed

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Kurrat (Liliaceae)	Bulb vegetables	+	++	N/AV	*+ Osmia, Hoplitis*	Yes	No	Extrapolated from leek in Table 1: 3, 5	Typically harvested prior to bloom. Requires pollination only when grown for seed; small % of acreage
Lily (Liliaceae)	Bulb vegetables	-	-	-	-	No	No	57	Rarely grown for seed
Onion (various varieties except green onion) (Liliaceae)	Bulb vegetables	+	+	+	+	For seed production, only	No	3, 14, 81, Attractiveness extrapolated from green onion in **Table 1**	Only a small % of acreage is grown for seed, but locally important (CA, AZ)
Shallot (Liliaceae)	Bulb vegetables	+	+	+	+	For seed production, only	No	3, 14, 81, Attractiveness extrapolated from green onion in **Table 1**	Only a small % of acreage is grown for seed, but locally important (CA, AZ)
Amaranth (Amaranthaceae)	Leafy Vegetables	+	+	+	+	Yes		94	Crop harvested prior to bloom
Arugula (Brassicaceae)	Leafy Vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Crop is harvested prior to bloom when not grown for seed production.
Cardoon (Asteraceae)	Leafy Vegetables	+	+	+	+	Yes	No	81, Attractiveness extrapolated from artichoke in **Table 1**	Crop is harvested prior to bloom when not grown for seed production.
Celery (Apiaceae)	Leafy Vegetables	+	+	+	+	Yes	No	3, Attractiveness to wild bees extrapolated from parsley	Crop harvested prior to bloom. Bees important for seed production.
Celtuce (Asteraceae)	Leafy Vegetables	+	+	+	+	No	No	Extrapolated from lettuce in **Table 1**	Crop is harvested prior to bloom when not grown for seed production.

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Chervil (Apiaceae)	Leafy Vegetables	+	+	+	+	No	No	3	Crop is harvested prior to bloom when not grown for seed production.
Chrysanthemum (Asteraceae)	Leafy Vegetables	+	+	+	+	No	No	81, extrapolation from pyrethrum in reference 3	Crop is harvested prior to bloom when not grown for seed production.
Corn salad (Valerianaceae)	Leafy Vegetables	*Uncertainty*[a]							Crop may be inherently attractive to bee pollinators, but harvested prior to bloom
Cress, garden (Brassicaceae)	Leafy Vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Crop is harvested prior to bloom when not grown for seed production.
Cress, upland (Brassicaceae)	Leafy Vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Crop is harvested prior to bloom when not grown for seed production.
Dandelion (Asteraceae)	Leafy Vegetables	++	++	++	++	No	No	80, Attractiveness extrapolated from lettuce in **Table 1**	Harvested prior to bloom. Flowers are removed by mechanical means when not grown for seed production. Important sources of nectar and pollen for all bee species early in the spring when few other flowers are blooming. All bumble bee species use it as a food source for early brood production.
Dock/sorrel (Polygonaceae)	Leafy Vegetables	*Uncertainty*[a]							Crop may be inherently attractive to bee pollinators, but harvested prior to bloom

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Endive (Asteraceae)	Leafy Vegetables	+	+	+	+	No	No	3, attractiveness extrapolated from lettuce in **Table 1**	Crop is harvested prior to bloom when not grown for seed production.
Fennel (Apiaceae)	Leafy Vegetables	++	++	+	+	Yes	No	3, Attractiveness to wild bees extrapolated from chervil above	Crop is harvested prior to bloom when not grown for seed production.
Orach (Chenopodiaceae)	Leafy Vegetables	*Uncertainty*[a]							Crop may be inherently attractive to bee pollinators, but harvested prior to bloom
Parsley (Apiaceae)	Leafy Vegetables	+	+	+	+	No	No	3, attractiveness ratings extrapolated from chervil above	Crop is harvested prior to bloom when not grown for seed production.
Purslane, garden (Apiaceae)	Leafy Vegetables	+	+	+	+	No	No	Extrapolated from chervil above	Crop is harvested prior to bloom when not grown for seed production.
Winter purslane (Portulaceae)	Leafy Vegetables	*Uncertainty*[a]							Crop may be inherently attractive to bee pollinators, but harvested prior to bloom
Radicchio (Asteraceae)	Leafy Vegetables	+	+	N/AV	*+Andrena, Anthidium, Halictus, Osmia*	Yes	N/AV	Attractiveness extrapolated from chicory in **Table 1**	Crop is harvested prior to bloom when not grown for seed production.
Rhubarb (Polygonaceae)	Leafy Vegetables	Open pollinated, rarely self-pollinated							Crop may be inherently attractive to bee pollinators, but harvested prior to bloom
New Zealand spinach (Aizoaceae)	Leafy Vegetables	*Uncertainty*[a]							Crop may be inherently attractive to bee pollinators, but harvested prior to bloom

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Swiss chard (Chenopodiaceae)	Leafy Vegetables	-	+	N/AV	+	Yes	No	Extrapolated from sugar beet in **Table 1**	Crop is harvested prior to bloom when not grown for seed production. Requires pollination only for breeding; small % of acreage
Vine spinach (Basellaceae)	Leafy Vegetables	*Uncertainty*[a]							Crop may be inherently attractive to bee pollinators, but harvested prior to bloom
Brussels sprouts (Brassicaceae)	Brassica leafy vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Harvested prior to bloom.
Cavalo broccolo (Brassicaceae)	Brassica leafy vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Harvested prior to bloom.
Collards (Brassicaceae)	Brassica leafy vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Harvested prior to bloom.
Kale (Brassicaceae)	Brassica leafy vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Harvested prior to bloom.
Kohlrabi (Brassicaceae)	Brassica leafy vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Harvested prior to bloom.
Mizuna (Brassicaceae)	Brassica leafy vegetables	++	++	+	+	No	No	Extrapolated from mustard seed and cabbage on **Table 1**	Harvested prior to bloom.

Che (Moraceae)	Berry and small fruit	*Uncertainty*[a]							
Chokecherry (Rosaceae)	Berry and small fruit	+	+	N/AV	N/AV	Yes	No	58, 59	
Cloudberry (Rosaceae)	Berry and small fruit	+	+	+	+	Yes	No	60, 61	
European barberry (Berberidaceae)	Berry and small fruit	*Uncertainty*[a]							
Highbush cranberry (Caprifoliaceae)	Berry and small fruit	*Uncertainty*[a]							
Edible honeysuckle (Caprifoliaceae)	Berry and small fruit	+	+	+	+	Yes	No	62	
Huckleberry (Ericaceae)	Berry and small fruit	+	+	++	++*Andrena, Colletes, Osmia, Anthophora, Xylocopa*	Yes	No	Extrapolated from blueberry in **Table 1**, similar flower	
Jostaberry (Grossulariaceae)	Berry and small fruit	-	+	+	+	Yes	No	63, Extrapolated from Currants in **Table 1**	
Juneberry (Rosaceae)	Berry and small fruit	+	+	+	+	Yes	No	7, 64	
Lingonberry (Ericaceae)	Berry and small fruit	+	+	+	+	Yes	No	65, 66	
Maypop (Passifloraceae)	Berry and small fruit	-	-	-	+ *Xylocopa*	Yes	No	67	
Mulberry (Moraceae)	Berry and small fruit	-	-	-	-	No	No	68	Wind pollinated
Partridgeberry (Rubiaceae)	Berry and small fruit	-	-	+	-	Yes	No	69	
Phalsa (Tiliaceae)	Berry and small fruit	+	+	+	+	Yes	No	3	

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Pin cherry (Rosaceae)	Berry and small fruit	++	+	+	++ *Osmia*	Yes	No	Extrapolated from cherry tree	
Salal (Ericaceae)	Berry and small fruit	+	+	++	++*Andrena, Colletes, Osmia, Anthophora, Xylocopa*	Yes	No	Extrapolated from blueberry in **Table 1**, similar flower	
Schisandra berry (Schisandraceae)	Berry and small fruit	*Uncertainty*[a]							
Beechnut (Fagaceae)	Tree nut	-	-	-	-	No	No	70	Wind pollinated
Brazil nut (Lecythidaceae)	Tree nut	+	+	++	+	No	No	15	
Bur oak (Fagaceae)	Tree nut	+	-	-	-	No	No	16	Wind pollinated
Butternut (Juglandaceae)	Tree nut	+	-	-	-	No	No	17	
Cashew (PR)(Anacardiaceae)	Tree nut	+	+	N/AV	N/AV	Yes	No	3	
Candlenut (Euphorbiaceae)	Tree nut	*Uncertainty*[a]							
Chinquapin (Fagaceae)	Tree nut	++	+	+	+	No	No	3	
Coconut (Arecaceae)	Tree nut	+	+	+	+	Yes	No	3	
Ginkgo (Ginkgoaceae)	Tree nut	-	-	-	-	No	No	18	
Guiana chestnut (PR) (Bombacaceae)	Tree nut	*Uncertainty*[a]							
Heartnut (Juglandaceae)	Tree nut	+	-	-	-	No	No	Similar to butternut (above), information transferred from above	
Hickory (Juglandaceae)	Tree nut	*Uncertainty*[a]							
Macadamia nut (PR) (Proteaceae)	Tree nut	+	+	N/AV	N/AV	Yes	No	3	

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Pachira (Bombacaceae)	Tree nut	*Uncertainty*[a]							
Peach palm nut (Arecaceae)	Tree nut	-	-	-	-	No	No	19	Pollinated by beetles
Pecan (Juglandaceae)	Tree nut	-	-	-	-	No	No	20	Wind pollinated
Pine nut (Pinaceae)	Tree nut	*Uncertainty*[a]							
Tropical almond (Combretaceae)	Tree nut	+	+	N/AV	N/AV	No	No	21	
Millet (Poaceae)	Cereal grains	+	-	-	-	No	No	Similar to Grasses (Poa) so information transferred from **Table 1**	Source of pollen only when no other forage sources are available
Popcorn (Poaceae)	Cereal grains	+	-	-	-	No	No	Similar to Grasses (Poa) so information transferred from **Table 1**	Source of pollen only when no other forage sources are available
Teosinte (Poaceae)	Cereal grains	+	-	-	-	No	No	Similar to Grasses (Poa) so information transferred from **Table 1**	Source of pollen only when no other forage sources are available
Wild rice (Poaceae)	Cereal grains	+	-	-	-	No	No	Similar to Grasses (Poa) so information transferred from **Table 1**	Source of pollen only when no other forage sources are available
Velvet bean (Fabaceae)	nongrass animal feeds	*Uncertainty*[a]							
Lupin (Fabaceae)	nongrass animal feeds	+	+	+	+	For seed production, only	For seed production, only	5	Only a small % of acreage is grown for seed using honey bees

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Crown vetch (Fabaceae)	nongrass animal feeds	+	+	++	++ *Megachile, Osmia*	For seed production, only	For seed production, only	Extrapolated from entry below	Only a small % of acreage is grown for seed. It is a poor seed producer as it produces little pollen or nectar,
Vetch (Fabaceae)	nongrass animal feeds	+	+	++	+ *Megachile, Osmia*	For seed production, only	For seed production, only	89	Only a small % of acreage is grown for seed using honey bees
Milk vetch (Fabaceae) *Astragalus* spp.	nongrass animal feeds	+	+	++	+ *Megachile*	For seed production, only	For seed production, only	96, 97	Only a small % of acreage is grown for seed; bumble bees more effective pollinators than honey bees or leafcutter bees.
Angelica (Apiaceae)	Herbs and spices	*Uncertainty*[a]							
Annatto (Bixaceae)	Herbs and spices	+	-	N/AV	N/AV	No	No	23	
Lemon balm (Lamiaceae)	Herbs and spices	+	+	+	+	No	No	24	
Basil (Lamiaceae)	Herbs and spices	+	+	+	+	For seed production, only	For seed production, only	7	Only a small % of acreage is grown for seed.
Borage (Boraginaceae)	Herbs and spices	+	++	+	+	For seed production, only	For seed production, only	25, 98, 99	Only a small % of acreage is grown for seed.
Burnet (Rosaceae)	Herbs and spices	+	+	+	+	No	No	26	
Camomille (Asteraceae)	Herbs and spices	+	+	N/AV	+	No	No	27, Extrapolated to potential US experience	
Black caraway (Ranunculaceae)	Herbs and spices	+	+	+	+	No	No	28, Extrapolated to potential US experience	
Caper buds (Capparaceae)	Herbs and spices	+	++	N/AV	+	For seed production, only	For seed production, only	29, Extrapolated to potential US experience	Only a small % of acreage is grown for seed.

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Catnip (Lamiaceae)	Herbs and spices	+	++	++	++	For seed production, only	For seed production, only	7, 30	Only a small % of acreage is grown for seed.
Celery seed (Apiaceae)	Herbs and spices	+	+	+	+	For seed production, only	For seed production, only	3	Only a small % of acreage is grown for seed.
Chinese chives (Liliaceae)	Herbs and spices	+	++	+	+	For seed production, only	For seed production, only	Extrapolated from chive, 3	Only a small % of acreage is grown for seed.
Cinnamon (Lauraceae)	Herbs and spices	+	+	N/AV	N/AV	For seed production, only	For seed production, only	31	Only a small % of acreage is grown for seed.
Clary (Lamiaceae)	Herbs and spices	+	+	+	+	For seed production, only	For seed production, only	7	Only a small % of acreage is grown for seed.
Costmary (Asteraceae)	Herbs and spices	+	+	+	+	For seed production, only	For seed production, only	Extrapolated from chamomile, 27	Only a small % of acreage is grown for seed.
Culantro (Apiaceae)	Herbs and spices	*Uncertainty*[a]							
Horehound (Lamiaceae)	Herbs and spices	+	+	+	+	For seed production, only	For seed production, only	Extrapolated from 24	Only a small % of acreage is grown for seed.
Hyssop (Lamiaceae)	Herbs and spices	+	+	++	++	For seed production, only	For seed production, only	7	Only a small % of acreage is grown for seed.
Lavendar (Lamiaceae)	Herbs and spices	+	++	++	++	For seed production, only	For seed production, only	3, 5	Only a small % of acreage is grown for seed.
Lemongrass (Graminae)	Herbs and spices	-	-	-	-	No	No	3	As a grass, primarily wind pollinated
Lovage (Apiaceae)	Herbs and spices	*Uncertainty*[a]							
Mace (Myristicaceae)	Herbs and spices	-	-	-	-	No	No	32	
Marigold (Asteraceae)	Herbs and spices	+	+	-	+	No	No	55	
Marjoram (Lamiaceae)	Herbs and spices	+	+	+	+	No	No	56	
Nasturtium (Tropaeolaceae)	Herbs and spices	+	+	++	+	No	No	7	
Nutmeg (Myristicaceae)	Herbs and spices	-	-	-	-	No	No	32	

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
Parsley (Apiaceae)	Herbs and spices	+	+	+	+	No	No	33	Bees important for seed production
Rue (Rutaceae)	Herbs and spices	+	+	+	+	Yes	No	85	Bees important for seed production
Rosemary (Lamiaceae)	Herbs and spices	++	++	+	+	No	No	34	Perennial shrub, propagated vegetatively
Sage (Lamiaceae)	Herbs and spices	*Uncertainty*[a]							
Savory (Lamiaceae)	Herbs and spices	+	+	+	+	Yes	No	86	Bees important for seed production
Tansy (Asteraceae)	Herbs and spices	+	+	+	+	No	No	35	
Tarragon (Asteraceae)	Herbs and spices	+	+	+	+	No	No	87	
Vanilla (Orchidaceae)	Herbs and spices	+	+	+	+	No	No	3	Flowers main pollinated by hand
Wintergreen (Ericaceae)	Herbs and spices	-	-	+	-	No	No	36	Flowers visited mostly by bumble bees
Wormwood (Asteraceae)	Herbs and spices	*Uncertainty*[a]							
Woodruff (Rubiaceae)	Herbs and spices	*Uncertainty*[a]							
Borage (Boraginaceae)	Oilseed	++	+	+	+	Yes	No	3, 37	
Calendula (Asteraceae)	Oilseed	+	+	+	+	Yes	No	3	
Chinese tallow (Euphorbiaceae)	Oilseed	+	+	+	+	Yes	No	3	
Crambe (Brassicaceae)	Oilseed	+	+	+	+	Yes	No	3	
Cuphea (Lythraceae)	Oilseed	+	+	+	+	Yes	No	3, 10	
Echium (Boraginaceae)	Oilseed	+	+	+	+	Yes	No	3	

Attractiveness of Agricultural Crops to Pollinating Bees for the Collection of Nectar and/or Pollen, 2017

Crop	EPA Crop Group	HB Poll[1]	HB Nec[1]	Bumble Bees	Solitary Bees	Requires Bee Pollination	Uses Managed Pollinators	Reference Number	Notes
